

Software development is a complex process, thus need to be thoroughly and carefully monitored and managed, but finding a suitable solution for this purpose sometimes seem to be impossible due to process coverage and/or ease of use and/or required maintenance and/or cost, and this can be very frustrating, and leads organizations in many cases to give up. However, from my very first exposure to *Orcanos QPack* I realized that it's nothing like I seen or experienced before – a solution that provides a full scale management throughout the entire process, starting from requirements management, throughout the relevant documentation, managing the development process, the testing process (including test management), defect tracking and a sophisticated reporting mechanism and a professional dashboard – and all that in an easy to configure and maintain, easy and extremely intuitive Web based interface. All that has a dramatic effect on our development and testing process, and allows us to be much more effective and efficient, and in any aspect of ROI terms, it's a winner.

Not to mention the fact that those guys (Orcanos) know their business – based on their flexibility, serviceability, maintainability, and above all – dynamic and relevant product roadmap that demonstrates the professionalism and the market needs relevancy
