

Quategra GmbH - Karl Heine Str. 99 - 04229 Leipzig

Testimonial

Quategra develops Hard- and Software for Embedded Systems. The Embedded Market is similar to other markets of software development when it comes to requirements. Often requirements change during the development process or were added to a project after its start. Quategra was looking for a tool not only to control and monitor requirements but all parts of a project in detail and to have it under an integrated version control.

We had examined some tools, but either it was too expensive or it doesn't meet our requirements and wishes – or both.

As we had seen Qpack first time, we were curious if it lives up to the promises made about it. And yes – it does.

We are working with Qpack about 4 months now and we are very contented with it. The way Orcanos cares about us with installation and first introduction into Qpack was excellent.

Qpack itself is very self-explanatory. You really can learn to handle it by doing and for open questions, the online help and support service of Orcanos is by your side. Because of the distance in time and area, we generally communicate via Email and all of our questions and issues are answered within hours. For urgent issues Orcanos is always within reach via phone or Skype.

Qpack really gives us the possibility to control a project. We set up a workflow according to our company's structure and size. This workflow ensures a standardized development process. With all the features offered by Qpack for documenting requirements, planning and executing test cases and last but not least, tracking defects, we can improve the quality of our development process. That means that we are in a position to guarantee a transparent and clearly structured process. Of course we still can make mistakes – everyone does – but we can show how defects are handled. And that's a valueable difference when it comes to the customer's satisfaction.
